Acknowledgments

Mississippi KIDS COUNT would like to express our sincere gratitude to the following entities; without their support and commitment, the production of this fact book would not be possible.

• The Annie E. Casey Foundation
• Mississippi State University’s Social Science Research Center - Dr. Arthur Cosby, Director
• Mississippi State University’s Division of Agriculture, Forestry, and Veterinary Medicine: Office of Agricultural Communications

MISSISSIPPI KIDS COUNT ADVISORY BOARD
Gary Blair - MS KIDS COUNT Chair
Mike Clayborne - CREATE Foundation
Nelle Cohen - Community Volunteer
Edward Hill, M.D. - North MS Health Services
Valerie Long - CATCH Kids, Inc.

The Family and Children Research Unit at Mississippi State University’s Social Science Research Center is excited to begin its eighth year as the Annie E. Casey Foundation’s KIDS COUNT grantee for the state of Mississippi. During this time we have produced seven Data Books, which have highlighted a number of issues that influence the quality of life for Mississippi’s children. To that end, Mississippi KIDS COUNT is committed to providing comprehensive and accurate information on demographics, health, education, safety, and the economic well-being of Mississippi’s children, families and communities. This year, our annual book has undergone significant changes. It has been renamed the “Fact Book,” shortened to emphasize key topics and trends in Mississippi, and stylized with the latest methods in graphic design and data visualization. The 2014 Fact Book focuses on indicators related to the health of children in Mississippi. The end product provides a wealth of information in a condensed format that is easily accessible. Please be sure to visit our website http://datacenter.kidscount.org/MS for more specific, county-level data.

The evidence is clear; the interconnections among children's health, education, and overall well-being are integral components of a brighter future for Mississippi’s children, and we welcome an opportunity to share more detailed information with you. In 2014, we will be traveling across Mississippi to provide data and demonstrate how to use data at the community and regional level. If you are interested in having members of our team visit your community, please contact us at: mskidscount@ssrc.msstate.edu or 662-325-8079.

Linda H. Southward
Director, Mississippi KIDS COUNT
Throughout my twenty years as a student in the public schools of Mississippi, from elementary through post-college graduate education, much has been written, discussed, and debated publically concerning the vital need for education system reform. These discussions have resulted in a few educational policy successes, painfully legislated and partially implemented with too little to show for all the social and political effort. Some have argued that Mississippi cannot afford the cost of real comprehensive education reform. How can we not "afford" to lower our school drop-out rate, prison incarceration levels, high rates of teen pregnancy, and other leading causes of ill health and death in children?

In my opinion, it is all about behaviors and finding methods to influence behavior change in a positive manner. Thus far we as an astute society have been coping versus influencing. The social determinants of health and education are tied closely together and are behavioral. These behaviors are preventable with workable strategies. We must not accept these negative, learned behaviors, and we must seek solutions. We cannot accept a 38.4% overweight/obesity rate, having 10 to 12 year olds smoking, having a high teenage pregnancy rate with 42.1% of Mississippi teens reporting that they are sexually active. We must institute a comprehensive, sequential, physical, mental, and emotional health education strategy for all our children. Implementing a strategy would definitively influence and affect real positive behavior change thereby reducing the enormous cost, ill health, suffering, and social decay caused by preventable behaviors.

It will take great courage and leadership to bring together small and large communities, counties, and all demographic groups in Mississippi to bring about a revolutionary change in reforming education in our state.

The Mississippi KIDS COUNT Fact Book provides the needed awareness, knowledge, and guidance to stimulate innovative strategies to meet a long-range and imperative goal of universal health education in Mississippi. Also, keep in mind that knowledge alone seldom changes behavior. The foundation for building habits in children is often well established in a child by the age of 10 years. Therefore this innovative educational reform strategy must begin even before school age.

In Mississippi our predominant goal must be the education, safety, health, and well-being of our children. The future of our state and nation will depend on how well we prepare them to be the progressive leaders the future will demand.
The 2014 Mississippi KIDS COUNT Fact Book marks the seventh annual publication of data depicting the status of children in our state. Once again, the facts point out the very significant problems that we in Mississippi must overcome, regarding our children’s general health and well-being.

There is no shortage of critical data made available by this invaluable and superb KIDS COUNT Fact Book. This data is available for use by social science researchers, legislators, state executive branch officials, state and local educators, schools, parents, business leaders, the medical and faith communities, and anyone interested in improving the well-being of our children and families. This data has already stimulated the development of Mississippi KIDS COUNT success stories in some regions of our state; however, these successful strategies have been too few and too scattered throughout the state.

These data have been utilized by grantees to access funds totaling over thirty-six and one-half million dollars in the past five years. Consequently, we are seeing some minimal but significant improvements in our child health measures since Mississippi now ranks forty-ninth instead of fiftieth in overall child well-being. There has been a decrease in the percentage of uninsured children, a lower rate of teen deaths and fewer teens using alcohol and other drugs. Also, we have seen a 13% decrease in elementary school overweight and obesity rates. Credit is certainly due to those involved in child health initiatives in communities around the state, as well as the roll-out of the Mississippi Healthy Students Act of 2007.

Progress is being made but much too slowly to begin to match the needs of childhood health if we expect our children to excel at the level required for the future needs of our state in education, economics, and social progress.

Edward Hill, M.D., FAAFP

Dr. Edward Hill, a member of the Mississippi KIDS COUNT Advisory Board, has spent more than 40 years as a board-certified family physician. In addition to serving on the faculty of North Mississippi Medical Center’s Family Medicine Residency Center, Dr. Hill maintains an active practice. He has served as the president of the American Medical Association, the chairman of the board for the World Medical Association, the chairman of the board of trustees and president of the Mississippi State Medical Association, president of the Mississippi Academy of Family Physicians, and president of the Southern Medical Association.

In 2013, Mississippi was ranked 48th in the health category of the KIDS COUNT state ranking of child well-being. Compared to last year’s ranking, Mississippi had a smaller share of uninsured children, lower teen deaths, and fewer teens abusing alcohol or drugs. The improvement in the health of Mississippi’s children has helped the state to move out of the 50th into the 49th spot in overall well-being for the first time in the 24-year history of the ranking.

As employer-based insurance coverage has decreased, Medicaid and CHIP (Children’s Health Insurance Program) coverage has increased.
Unintentional injury continues to be the leading cause of death in Mississippi children under 18 years of age. The majority of these deaths are due to motor vehicle accidents. Distracted driving, or driving while texting, using a cell phone, or eating, increases the risk of a motor vehicle accident. Younger drivers (under age 20) are particularly vulnerable, having the highest proportion of fatal crashes involving distracted driving.10

"Texting and cell phone use behind the wheel significantly increases a driver’s risk of crashing. Even a single, momentary distraction while driving can cause a lifetime of devastating consequences." -Anthony Foxx, U.S. Secretary of Transportation

Children in Mississippi who are uninsured or covered by Medicaid/CHIP are more likely to have untreated tooth decay than those who are covered by private insurance.6

Nearly half of all U.S. high school students aged 16 years or older text or email while driving.8

Drivers are 4 times more likely to cause an accident when intoxicated, but 8 times more likely to cause an accident while texting.7

**LEADING CAUSES OF DEATH IN CHILDREN AGES 1-17 (2006-2010)**

- UNINTENTIONAL INJURY*
- HOMICIDE

**SELF-REPORTED* SAFETY BEHAVIORS AMONG HIGH SCHOOL STUDENTS (2011)**

- RARELY OR NEVER WORE A BICYCLE HELMET: 88%  
- RARELY OR NEVER WORE A SEAT BELT: 8%  
- RODE WITH A DRIVER WHO HAD BEEN DRINKING: 24%  
- DROVE WHEN DRINKING ALCOHOL: 8%
Parents in Mississippi were asked to describe the weight category of their child and provide their child's height and weight. There was a significant disconnect between perception and their child's actual BMI (Body Mass Index) weight category.13

The Child and Youth Prevalence of Obesity Survey (CAYPOS) revealed that Black students of both genders had higher obesity rates than White students.15
BULLYING IN SCHOOLS

Cyberbullying differs from traditional bullying because bullies have more anonymity, distance, and access. Girls both engage in and are victims of cyberbullying at higher rates than boys. When boys cyberbully they tend to post mean pictures, while girls prefer to spread rumors. Current Mississippi bullying laws are limited in their ability to address cyberbullying, as they only cover cyberbullying on school property, at a school event, or on a school bus.

Girls both engage in and are victims of cyberbullying at higher rates than boys. When boys cyberbully they tend to post mean pictures, while girls prefer to spread rumors. Current Mississippi bullying laws are limited in their ability to address cyberbullying, as they only cover cyberbullying on school property, at a school event, or on a school bus.

"The stereotype of a bully is that he's male, overweight and a stranger. But a lot of what we are learning about girls is that they hurt their friends."

-Rachel Simmons, Author of Odd Girl Out

“`The more adverse experiences in childhood, the greater the likelihood of developmental delays and other problems.°”`

-Jack Shonkoff, M.D., Center on the Developing Child at Harvard University

PERCENTAGE OF CHILDREN WHO RECEIVED DEVELOPMENTAL SCREENINGS:

- North Carolina was ranked first in the percentage of children ages 10 months to 5 years who received a developmental screening, while Mississippi was ranked 50th.

ACCORDING TO A 2013 SURVEY* OF MISSISSIPPI KINDERGARTEN TEACHERS, NEARLY ONE-THIRD OF KINDERGARTEN STUDENTS LACK SIGNIFICANT ADULT INVOLVEMENT AT HOME.²²

TWO OR MORE ADVERSE CHILDHOOD EXPERIENCES (2011-2012)

Children living in high poverty are more likely to experience two or more adverse experiences, such as parental divorce, domestic violence, discrimination, and exposure to individuals with poor mental health or substance abuse problems.²⁴
Chapter Three: Sexual & Reproductive Health

Human Papillomavirus (HPV) is...27-32

- The most common STI in the United States among older teens and young adults
- The leading cause of cervical cancer
- The Good News: HPV vaccine has been available since 2006
- The Bad News: At 46%, Mississippi adolescents have the lowest vaccination percentage in the United States

The Result...

A vaccination series costing at most $390* can help prevent early stage cervical cancer, which to treat costs an average of $20,250

*Available for as low as $30 at your local county health department

Self-Reported Sexual Behaviors in Teens (2011)22

- 58% of Mississippi teens reported having had sex at least once
- 12% of Mississippi and 6% of United States reported being sexually active before age 13
- 11% of Mississippi and 13% of United States reported NOT using any method of birth control during last intercourse

STI* Risk Increases as Number of Sexual Partners Increases25

- 22% of Mississippi and 15% of United States

STI Rates* (2012)26

- Mississippi: 715 cases of Chlamydia, 196 cases of Gonorrhea, 25 new HIV cases
- United States: 458 cases of Chlamydia, 104 cases of Gonorrhea, 19 new HIV cases

*sexually transmitted infection

*rate per 100,000

  - OKTIBBEHA: 22
  - LAFAYETTE: 23
  - BENTON: 29
  - CHOCTAW: 30
  - HANCOCK: 32

“[The teen birth rate] costs the children; they’re often born too early and too small and they’re much more likely to grow up in poverty. It costs the moms—they are much more likely to drop out of school and never get a high school diploma. They’re much more likely to be on welfare or making minimum wage; it costs taxpayers. … There are $9 billion in costs to U.S. taxpayers.”

-Mary Currier, M.D., Mississippi State Health Officer

SEX EDUCATION (2012)

- **92%** of parents support abstinence plus curriculum
- **48%** of school districts teach abstinence plus curriculum

CONSEQUENCES OF NEGATIVE BIRTH OUTCOMES

The consequences of negative birth outcomes impact infants, mothers, and society at large. These include the following:

**FINANCIAL COSTS:**
- In 2009, births to teen mothers cost Mississippi taxpayers $155 million.
- The average cost for low-birthweight baby hospital stays, excluding delivery costs, was 25 times higher than healthy babies.

**EDUCATIONAL DELAYS:**
- Teen mothers are more likely to become high school dropouts. Only 40% of teen mothers finish high school.
- Children of teen moms are more likely to have lower proficiency scores and cognitive attainment upon entering kindergarten, and are also more likely to drop out of high school.

**HEALTH RISKS:**
- Low-birthweight babies are at increased risk of infant mortality, respiratory distress syndrome, bleeding in the brain, heart problems, intestinal problems, and eye conditions.
- Low-birthweight babies are more likely to develop chronic health issues like high blood pressure, diabetes, and heart disease later in life.
